*This is your 2023 Annual Drinking Water Quality Report*

**LOCAL POSTAL CUSTOMER**

***Kinross Charter Township Water and Sewer Department  
 2023 Annual Drinking Water Quality Report***

We're very pleased to provide you with this year's Annual Quality Water Report. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is and always has been to provide to you a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

Our water comes from deep wells; two located near the 500,000-gallon water tower and three wells located near the 250,000-gallon water tower. All of our public water wells are 12 inches in diameter and are drilled to depths between 175 and 212 feet. Our two newest wells were installed by the Corps of Engineers and brought on line in April of 2001. We took one well off-line because of sand issues and had a new well drilled. Water is pumped from these wells directly into the distribution system. Chlorine is added to the water to kill harmful bacteria.

We are pleased to report that our drinking water is safe and meets federal and state requirements. If you have any questions about this report or concerning your water utility, please contact the Superintendent of the Water and Sewer Department. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. Township Board meetings are held on the first and third Mondays of each month at 7:00 p.m. at the Kinross Township Hall, 4884 W. Curtis Street in Kincheloe.

Kinross Charter Township Water and Sewer Department routinely monitors for contaminants in your drinking water according to Federal and State laws. The table shows the results of our monitoring for the period of January 1<sup>st</sup> to December 31<sup>st</sup>, 2023. As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances.

All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily pose a health risk. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

In the following table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

<b>Non-Detects (ND)</b> - laboratory analysis indicates that the constituent is not present.	<b>Parts per million (ppm) or Milligrams per liter (mg/l)</b> - one part per million corresponds to one minute in two years or a single penny in \$10,000.
<b>Parts per billion (ppb) or Micrograms per liter</b> - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.	<b>Action Level (AL)</b> - the concentration of a contaminant, which if exceeded, triggers treatment or other requirements that a water system must follow.
<b>Maximum Contaminant Level</b> - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.	<b>Maximum Contaminant Level Goal</b> - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
<b>Maximum Residual Disinfectant Level (MRDL)</b> - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.	<b>Maximum Residual Disinfectant Level Goal (MRDLG)</b> : The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
<b>Treatment Technique (TT)</b> - A required process intended to reduce the level of a contaminant in drinking water.	

**Lead and Copper—Regulated at Customer Tap--Most recent testing, 20 Samples taken August 2022**  
**Sampling is required every 36 months**

Contaminant Subject to Action Level	Violation	Action Level	MCLG	90% of Samples ≤ this level	Year Sampled	Range of all results	Typical Source of Contaminant
Lead (ppb)**	No	15	0	2 ppb	2022	ND to 3 ppb	Lead service lines, corrosion of household plumbing including fittings and fixtures; Erosion of natural deposits
Copper (ppb)	No	1300	1300	0 ppb	2022	0 to 10 ppb	Corrosion of household plumbing systems; Erosion of natural deposits

\*\*90 percent of the samples collected were at or below the level reported for our water.

**TEST RESULTS**

Substance	MCL	MCGL/MRDLG	Level Detected	Range	Year Sampled	Violation Yes/No	Typical Source of Contaminant
<b>Regulated Contaminants</b>							
Nitrate (ppm)	10	10	1.8	0.56 to 1.8	2023	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
TTHM Total Trihalomethanes (ppb)	80	N/A	3.8	2.0 to 3.8	2023	No	Byproduct of drinking water disinfection
HAA5 Haloacetic Acids (ppb)	60	N/A	0	ND	2023	No	Byproduct of drinking water disinfection
Perfluorobutane sulfonic acid (PFBS) (ppt)	420	N/A	<2.0	<2.0	2023	No	Discharge and waste from industrial facilities; stain-resistant treatments
PFHxA	400000	N/A	4.1	<2.0 to 4.1	2023	No	Firefighting foam; discharge and waste from industrial facilities
Perfluorohexane sulfonic acid (PFHxS) (ppt)	51	N/A	9.5	<2.0 to 9.5	2023	No	Firefighting foam; discharge and waste from industrial facilities
Chlorine <sup>2</sup> (ppm)	4	4	.20	0.11 to .31	2023	No	Water additive used to control microbes

<sup>2</sup> The Chlorine "Level Detected" was calculated using a running annual average, beginning April 2022

**Unregulated Contaminants**

Substance	Unit of Measure	Range of level detected	Typical Source of Contaminant
Sodium	ppm	1.5 to 2.1	Erosion of natural deposits

**Unregulated contaminants** are those for which EPA has not established drinking water standards. Monitoring helps EPA determine where these contaminants occur and whether it needs to regulate those contaminants. All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man-made. These substances can be: **Inorganic contaminants**, such as salts and metals, can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming. MCL's are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

**Lead:** If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Kinross Charter Township Water and Sewer Department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or at <http://water.epa.gov/drink/info/lead>.

*The State of Michigan performed an assessment of our source water in 2003 to determine the susceptibility or the relative potential of contamination. The rating is on a 6-tiered scale from "very low" to "high" based on geologic sensitivity, water chemistry and contaminant sources. The susceptibility of our source is "high" for all of our well sites. If you would like to know more about the report, please contact the **Superintendent of Kinross Township Water and Sewer Department at 906-495-5134**. Please call our office at 906-495-5134 if you have any questions. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life, and our children's future.*
